User Stories

2.BACKLOG

3.SL2 Sprint 1

A. In To-Do

B. IN Progress

C. In DONE Phase

4.SL2 Sprint 2

A. In To-Do

B. IN Progress

C. In DONE Phase

Burndown Charts

The burndown chart showed that the planned work was completed within the sprint. The sharp decrease in remaining work occurred because the sprint was simulated and the stories were completed within a short period rather than gradually throughout the week.

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes, the estimations reasonably reflected the effort required for the user stories. We used Fibonacci story points based on complexity and uncertainty. Smaller tasks such as processing webhooks and identifying suppliers were given 3 points, while more complex tasks such as splitting multi-supplier orders were given 8 points. Since the sprints were completed successfully, the estimates were generally appropriate.

2. Was your backlog well-prioritized?

Yes, the backlog was well-prioritized based on business importance and dependencies. The core order-processing, inventory verification, supplier identification, and dispatch activities were given higher priority because they are important for completing the main order workflow. Shipment tracking and order monitoring were given medium priority. This helped us decide which stories should be included in the first sprint.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned well with our plan. We selected the planned user stories for Sprint 1 and Sprint 2, assigned story points, and moved the stories through To Do → In Progress → Done. Both sprints were completed as planned. The simulation helped us understand how work is organized and tracked during a Scrum sprint.

4. What insights did the burndown chart give about your team's capacity?

The burndown charts showed that the planned work was completed within the sprint. The charts started with the planned story points and decreased as the stories were completed. The sharp decrease also showed that the work was completed quickly because we simulated the sprint rather than performing the work over an actual week. This helped us understand the team's capacity and the importance of estimating and distributing work properly across a sprint.
